

1. Benefits	<p>Responsiveness□</p> <p>Resource Sharing□</p> <p>Economy□</p> <p>Utilization of MP Architectures</p>	12. Two general approaches:	<p>Asynchronous cancellation terminates the target thread immediately</p> <p>Deferred cancellation allows the target thread to periodically check if it should be cancelled</p>
2. Kernel Threads	<p>Supported by the Kernel</p> <p>Examples: Windows, XP/2000, Solaris, Linux, Tru64 UNIX, Mac OS X</p>	13. Two-level Model	<p>Similar to M:M, except that it allows a user thread to be bound to kernel thread</p> <p>Examples:</p> <p>IRIX</p> <p>HP-UX</p> <p>Tru64 UNIX</p> <p>Solaris 8 and earlier</p>
3. Linux Threads	<p>Linux refers to them as tasks rather than threads</p> <p>Thread creation is done through clone() system call</p> <p>clone() allows a child task to share the address space of the parent task (process)</p>	14. User Threads	<p>Thread management done by user-level threads library</p>
4. Many-to-Many Model	<p>Allows many user level threads to be mapped to many kernel threads</p> <p>Allows the operating system to create a sufficient number of kernel threads</p> <p>Examples: Solaris prior to version 9, Windows NT/2000 with the ThreadFiber package</p>	15. Windows XP Threads	<p>Implements the one-to-one mapping</p> <p>Each thread contains</p> <p>A thread id</p> <p>Register set</p> <p>Separate user and kernel stacks</p> <p>Private data storage area</p> <p>The register set, stacks, and private storage area are known as the context of the threads</p> <p>The primary data structures of a thread include:</p> <p>ETHREAD (executive thread block)</p> <p>KTHREAD (kernel thread block)</p> <p>TEB (thread environment block)</p>
5. Many-to-One	<p>Many user-level threads mapped to single kernel thread</p> <p>Examples:</p> <p>Solaris Green Threads</p> <p>GNU Portable Threads</p>		
6. Multithreading Models	<p>Many-to-One□</p> <p>One-to-One□</p> <p>Many-to-Many</p>		
7. One-to-One	<p>Each user-level thread maps to kernel thread</p> <p>Examples:</p> <p>Windows NT/XP/2000</p> <p>Linux</p> <p>Solaris 9 and later</p>		
8. Pthreads	<p>A POSIX standard (IEEE 1003.1c) API for thread creation and synchronization</p> <p>API specifies behavior of the thread library, implementation is up to development of the library</p> <p>Common in UNIX operating systems (Solaris, Linux, Mac OS X)</p>		
9. Thread Cancellation	<p>Terminating a thread before it has finished</p>		
10. Threading Issues	<p>Semantics of fork() and exec() system calls</p> <p>Thread cancellation</p> <p>Signal handling</p> <p>Thread pools</p> <p>Thread specific data</p> <p>Scheduler activations</p>		
11. Three primary thread libraries:	<p>POSIX Pthreads</p> <p>Win32 threads</p> <p>Java threads</p>
